

Problem!

Malcolm Taylor (our client) said;

“I have had a big problem with pigeons fouling and nesting on the glass roofs on either side of our tower blocks. How do you proof a virtually flat glass roof 12 floors up? I was really interested when *Bird Free* came along.

“Because the work needs to be done by abseiling it took some organising. We treated one block as a test and we were delighted with the results. You see the birds fly from their nesting sites towards the roofs and then turn away. It appears not a single bird has landed since the treatment.

On either side of the roof of Radley House, Thamesmead, are two glass canopies separated by a central wall. Pigeons had been nesting and roosting in the sheltered parts of the canopies on the west side of the roof, and had been using the edges of the canopies on the east side as a day roost. The photos below show the heavily infested parts of the canopies on the west side of the roof before cleaning.

Before

BIRD FREE®

The Solution!

All fouling was cleaned from the four glass canopies on the morning of 11 April 2012 by Absen Rope Access's abseiling team who then applied *Bird Free* to all four canopies. The *Bird Free* application took a total of two hours.

“Although we had allowed a whole day for the job, Absen rope access's team were extremely efficient and professional, and delivered an excellent job which continues to keep the pigeons at bay”. it's now clear that using Absen and rope access techniques we could do two roofs in one day. This means a reduction in our costs of about 40%.”

Absen is happy to be appointed as a UK distributor of Bird free and Silver Bird Free. We are able to offer full deep clean to already fouled areas and the installation of Bird Free and Silver Bird Free gel.
